Brian Cellio, DVM  
*Diplomate American College of  
Veterinary Internal Medicine  
(Neurology)*

Diseases of the nervous system can be the most difficult to diagnose. Experience, specialized diagnostic skills, and modern technology are frequently required.

Whether your pet is suffering from seizures, spinal cord or brain injury, a "slipped disc", pain, weakness, a locomotive difficulty, or another unusual nervous system disorder, our neurologist has the training, experience and skills to diagnose these conditions.

A thorough neurologic exam is the cornerstone to evaluating your pet's condition. Computerized tomography (CT scanning), magnetic resonance imaging (MRI), spinal taps, specialized blood testing and x-ray procedures are just some of the technologies that can now be used to aid in the diagnosis of your pet's illness.

To help your beloved pet regain his or her health, our neurologist can offer specific medical treatments and cutting edge surgical procedures, including radiation therapy. Should your pet be hospitalized, our compassionate nursing staff ensures that he or she is comfortable, clean and free of pain 24 hours per day. 🌸

***Further enhancing your pet's return to good health are specialized medical therapies along with cutting edge surgical procedures, including radiation therapy.***
